

FIRST AID TREATMENT FOR ANAPHYLAXIS

Anaphylaxis is a severe allergic reaction and potentially life threatening. It should always be treated as a medical emergency, requiring immediate treatment. Most cases of anaphylaxis occur after a person with a severe allergy is exposed to the allergen they are allergic to (usually a food, insect or medication).

STEP 1

In some cases, anaphylaxis is preceded by signs of a mild to moderate allergic reaction:

- Swelling of face, lips and eyes
- Hives or welts on the skin
- Tingling mouth
- Stomach pain, vomiting (these are signs of a mild to moderate allergic reaction to most allergens, however, in insect allergy these are signs of anaphylaxis).

ACTION

- For insect allergy, flick out the sting if it can be seen (but do not remove ticks)
- Stay with person and call for help
- Give medications if prescribed (whilst antihistamines may be used to treat mild to moderate allergic reactions, if these progress to anaphylaxis then adrenaline is the only suitable medication)
- Locate **adrenaline autoinjector** if available (instructions are included in the Action Plan for Anaphylaxis which should be stored with the adrenaline autoinjector)
- Contact parent/guardian or other emergency contact.

STEP 2

Continue to watch for any one of the following signs of anaphylaxis (severe allergic reaction):

- Difficult/noisy breathing
- Swelling of tongue
- Swelling/tightness in throat
- Difficulty talking and/or hoarse voice
- Wheeze or persistent cough
- Loss of consciousness and/or collapse
- Pale and floppy (in young children)

ACTION

- **Give the adrenaline autoinjector** if available (instructions are included in the ASCIA Action Plan for Anaphylaxis, stored with the adrenaline autoinjector)
- **Call Ambulance** (Telephone 000 in Australia, 111 in New Zealand or 112 if using a mobile phone)
- **Lay person flat and elevate legs - if breathing is difficult, allow to sit but do not stand**
- Contact parent/guardian or other emergency contact
- Further adrenaline doses may be given (when an additional adrenaline autoinjector is available), if there is no response after 5 minutes.

If in doubt, give the adrenaline autoinjector

- **Adrenaline is life saving and must be used promptly. Withholding or delaying the giving of adrenaline can result in deterioration and death.** This is why giving the adrenaline autoinjector is the first instruction on the ASCIA Action Plan for Anaphylaxis. If cardiopulmonary resuscitation (CPR) is given before this step there is a risk that adrenaline is delayed or not given.
- **In the ambulance** oxygen will usually be administered to the patient by paramedics.
- **Medical observation** of the patient in hospital for at least 4 hours is recommended after anaphylaxis.
- **Adrenaline autoinjectors** available in Australia and New Zealand are EpiPen and Anapen. The Junior versions of EpiPen and Anapen are generally prescribed for children aged 1 to 5 years.
